🕵️ “The Page That Loads Wrong”

Story (Read This First)

> You joined a company as a front-end developer. On your **first day**, you open the website and realize:
>
> Some content is wrong, Some elements are missing, Some elements should not exist

> The page **loads once** — no clicks, no typing, no forms. Your mission is to **fix the page using JavaScript only**.

You are NOT allowed to use:

- `addEventListener`
- Any event handling

Your code runs **once when the page loads**.

Given HTML (DO NOT EDIT)

```html
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8" />
    <title>Broken Page</title>

    <style>
      .highlight {
        background-color: #ffeaa7;
        padding: 10px;
      }

      .hidden {
        display: none;
      }
    </style>
  </head>
  <body>
    <div id="app">
      <h1 id="mainTitle">???</h1>

      <p class="description hidden">This page is not ready yet.</p>

      <ul id="features">
        <li class="feature">Feature A</li>
        <li class="feature">Feature B</li>
        <li class="feature">REMOVE ME</li>
      </ul>

      <a id="mainLink" href="#">Broken Link</a>
```

```
    </div>

    <script src="script.js"></script>
  </body>
</html>
```

Your Mission

◇ Task 1 — Investigation

1. Select the following elements using JavaScript:
   - The main title
   - All feature list items
   - The description paragraph
2. Log to the console:
   - The text inside the main title
   - The HTML inside the description paragraph

◇ Task 2 — Fix the Content

1. Change the title text to: **"Welcome to the Dashboard"**
2. Update the description text to something meaningful (your choice).
3. Make the description visible.

◇ Task 3 — Styling the Page

1. Add the class `highlight` to the main title.
2. Make sure the description does **not** have the `hidden` class.

◇ Task 4 — Clean the Page

1. Remove the list item that contains the text **"REMOVE ME"**.

◇ Task 5 — Add Missing Content

1. Create a new `<h2>` element.
2. Set its text to: **"Available Features"**
3. Insert it **before** the features list.

◇ Task 6 — Repair the Link

1. Read the current `href` value of the link and log it.

2. Update the link so it points to: `https://example.com`
3. Change the link text to: **"Go to Dashboard"**
